Preface	xvii
Book roadmap	xviii
Acknowledgements	xix
I Programming and Geometry	xxi
1 Introduction to FL and PLaSM	1
1.1 Introduction to symbolic design programming	2
1.1.1 Computational model	3
1.2 Getting started with PLaSM	4
1.2.1 Installing the language	4
1.2.2 Using the language	6
1.3 Programming at Function Level	10
1.3.1 Elements of FL syntax	10
1.3.2 Combining forms and functions	11
1.4 Basics of PLaSM programming	15
1.4.1 Expressions	15
1.4.2 User-defined functions	16
1.4.3 Built-in functions	17
1.5 Geometric operators	23
1.5.1 Pre-defined geometric operators	23
1.6 Examples	37
1.6.1 First programs	37
1.6.2 Further examples	41
1.6.3 Virtual Manhattan	43
1.6.4 Virtual skyscraper	45
1.6.5 Roof of S. Stefano Rotondo	46
1.7 Annotated references	47
2 Geometric programming	51
2.1 Basic programming	51
2.1.1 Some operations on numbers	52
2.1.2 Set operations	59
2.1.3 Vector and matrix operations	61

2.1.4	String and character operations	64
2.1.5	Other examples	67
2.1.6	Pipeline paradigm	72
2.2	Basic geometric programming	73
2.2.1	Primitive shapes	73
2.2.2	Non-primitive shapes (simplicial maps)	76
2.3	Assembling shapes	84
2.3.1	Primitive alignments	84
2.3.2	Relative arrangements	86
2.4	Examples	88
2.4.1	Parametric nut stack	88
2.4.2	Hierarchical temple	89
3	Elements of linear algebra	95
3.1	Vector spaces	95
3.1.1	Bases and coordinates	97
3.1.2	PLaSM representation of vectors	97
3.2	Affine spaces	99
3.2.1	Operations on vectors and points	100
3.2.2	Positive, affine and convex combinations	100
3.2.3	Linear, affine and convex independence	102
3.2.4	Convex coordinates	104
3.2.5	Euclidean spaces	106
3.3	Linear transformations and tensors	108
3.3.1	Tensor operations	109
3.3.2	Coordinate representation	112
3.3.3	PLaSM matrix representation	113
3.3.4	Determinant and inverse	118
3.3.5	Orthogonal tensors	119
3.3.6	PLaSM representation of tensors	120
4	Elements of polyhedral geometry	123
4.1	Basic concepts	123
4.2	Convex sets	125
4.2.1	Positive, affine and convex hulls	125
4.2.2	Support, separation, extreme points	129
4.2.3	Duality	130
4.2.4	Boundary structure	132
4.3	Polyhedral sets	133
4.3.1	Extremal points	133
4.3.2	Double description	134
4.4	Polytopes	135
4.4.1	Examples of polytopes	135
4.4.2	Faces of polytopes	140
4.4.3	Projection	142
4.5	Simplicial complexes	144
4.5.1	Definitions	144

4.5.2	Linear d -Polyhedra	147
4.5.3	Fractal d -simplex	148
4.6	Polyhedral complexes	149
4.6.1	Schlegel diagrams	152
4.7	Nef polyhedra	153
4.7.1	Locally adjoined pyramids	154
4.7.2	Faces of Nef polyhedra	156
4.8	Linear programming	156
4.8.1	Geometry of linear programming	158
4.8.2	Simplex method	158
4.8.3	Some polyhedral algorithms	161
4.9	Examples	163
4.9.1	Platonic solids	163
4.10	References	168
5	Elements of differential geometry	169
5.1	Curves	169
5.1.1	Variable-free notation	170
5.1.2	Reparametrization	174
5.1.3	Orientation	175
5.2	Differentiation	176
5.2.1	Real-valued maps of a real variable	176
5.2.2	Vector-valued maps of a real variable	180
5.2.3	Real-valued maps of several real variables	183
5.2.4	Vector-valued maps of several real variables	186
5.2.5	Generalized implementation	188
5.3	Fields and differential operators	189
5.3.1	Gradient	189
5.3.2	Divergence and Laplacian	191
5.3.3	Curl	192
5.3.4	Gradient, divergence and curl of a 3D field	192
5.4	Differentiable manifolds	194
5.4.1	Charts and atlases	195
5.4.2	Differentiable manifolds	195
5.4.3	Tangent spaces and maps	198
5.5	Derivatives of a curve	198
5.6	Examples	200
5.7	Intrinsic properties of a surface	205
5.7.1	First fundamental form	208
5.7.2	Second fundamental form	210
5.7.3	Gauss curvature	211
5.8	Examples	212
5.8.1	Color map of the Gauss curvature field	212

II Graphics	215
6 Affine transformations	217
6.1 Preliminaries	217
6.1.1 Transformations	217
6.1.2 Points and vectors	218
6.1.3 Orientations and rotations	219
6.1.4 Homogeneous coordinates	219
6.2 2D Transformations	221
6.2.1 Translation	221
6.2.2 Scaling	224
6.2.3 Reflection	226
6.2.4 Rotation	227
6.2.5 Shearing	232
6.2.6 Generic transformation	233
6.2.7 Tensor properties	234
6.2.8 Fixed point transformations	236
6.3 3D Transformations	237
6.3.1 Elementary transformations	237
6.3.2 Rotations	240
6.3.3 Rotations about affine axes	243
6.3.4 Algebraic properties of rotations	243
6.4 PLaSM implementation	246
6.4.1 Pre-defined affine tensors	246
6.4.2 User-defined affine tensors	249
6.5 Examples	250
6.5.1 Modeling applied 3D vectors and reference frames	250
7 Graphic primitives	257
7.1 Some background	257
7.1.1 GKS	257
7.1.2 PHIGS	259
7.1.3 Open GL	260
7.1.4 Open INVENTOR	261
7.1.5 VRML	262
7.1.6 Java 3D	263
7.2 Basic primitives	265
7.2.1 Points	265
7.2.2 Polyline	266
7.2.3 Polymarker	269
7.2.4 Text	272
7.2.5 Triangle strip	277
7.2.6 Triangle fan	279
7.2.7 Quadrilateral mesh	281
7.3 Quotient set of polylines	284
7.3.1 Basic definitions	285
7.3.2 Interpolation of shapes	291

7.3.3	Shape compatibility	295
7.3.4	Shape resemblance	298
7.4	Examples	299
7.4.1	Quadrilateral array with holes	300
7.5	Annotated references	302
8	Hierarchical structures	303
8.1	Hierarchical graphs	303
8.1.1	Local coordinates and modeling transformation	304
8.2	Hierarchical structures	305
8.2.1	Hierarchical structures in PLaSM	306
8.2.2	Assembly using global coordinates	307
8.2.3	Assembly with local coordinates	308
8.3	Traversal	308
8.4	Implementations	310
8.4.1	Structure network in PHIGS	310
8.4.2	Hierarchical scene graph in VRML	311
8.5	Examples	315
8.5.1	Living room modeling	315
8.5.2	Body model	320
8.5.3	Umbrella modeling (1): structure	323
8.5.4	Tree diagrams	325
8.5.5	Array of aligned graphics symbols	328
9	Graphic pipelines	333
9.1	2D pipeline	333
9.1.1	Coordinate systems	333
9.1.2	Normalization and device transformations	335
9.1.3	Window-viewport mapping	336
9.2	3D pipeline	339
9.2.1	View model	340
9.2.2	Coordinate systems	341
9.2.3	Transformations of coordinates	342
9.2.4	View orientation	344
9.2.5	View mapping	345
9.2.6	Perspective transformation	350
9.2.7	Workstation transformation	351
9.3	Other implementations	353
9.3.1	Scalable vector graphics (SVG)	355
9.3.2	Open Inventor camera model	357
9.3.3	Java 3D viewing model	357
9.4	Examples	359
9.4.1	PHIGS! pipeline display	359
9.4.2	VRML camera implementation	361
10	Viewing and rendering	367
10.1	View-model	367

10.1.1	View parameters	369
10.1.2	View volume	370
10.2	Taxonomy of projections	371
10.2.1	Perspective	371
10.2.2	Parallel	374
10.3	Hidden-surface removal	382
10.3.1	Introduction	382
10.3.2	Pre-processing	383
10.3.3	Scene coherence	386
10.3.4	Back-to-front and front-to-back	392
10.3.5	Binary Space Partition	392
10.3.6	HSR algorithms in image-space	396
10.4	Illumination models	398
10.4.1	Diffuse light	400
10.4.2	Specular reflection	401
10.5	Color models	404
10.6	Shading models	412
10.7	VRML rendering	416
10.7.1	Illumination	417
10.7.2	Color	420
10.7.3	Shading	421
10.7.4	Textures	423
10.7.5	PLaSM lighting	424
10.7.6	PLaSM texturing	426
10.8	Examples	433
10.8.1	Orthogonal projection on any viewplane	433
10.8.2	Model of example house	433
10.8.3	Cell extraction	435
10.8.4	Exploded views	437
10.8.5	Standard view models	437
10.9	Annotated references	438
III Modeling		439
11	Parametric curves	441
11.1	Curve representations	441
11.2	Polynomial parametric curves	444
11.2.1	Linear curves	446
11.2.2	Quadratic curves	448
11.2.3	Cubic curves	449
11.2.4	Higher-order Bézier curves	455
11.3	Polynomial splines	459
11.3.1	Cubic cardinal splines	459
11.3.2	Cubic uniform B-splines	461
11.3.3	Non-uniform polynomial B-splines	465
11.3.4	Multiresolution Bézier and B-splines	470

11.4 Rational curves and splines	472
11.4.1 Rational Bézier curves	473
11.4.2 NURBS	474
11.5 Examples	478
11.5.1 Shape design with a NURB spline	478
11.5.2 Umbrella modeling (2): curved rods	480
11.6 Splines implementation	480
11.6.1 Cubic uniform splines	481
11.6.2 Non-uniform B-splines	486
11.6.3 Non-uniform rational B-splines	494
12 Parametric surfaces and solids	497
12.1 Introduction	497
12.1.1 Parametric representation	498
12.2 Notable surface classes	499
12.2.1 Profile product surfaces	499
12.2.2 Ruled surfaces	503
12.2.3 Cylinders and cones	505
12.3 Tensor product surfaces	508
12.3.1 Bilinear and biquadratic surfaces	511
12.3.2 Bicubic surfaces	514
12.3.3 Fixed-degrees tensor product surfaces	521
12.3.4 NURB surfaces	523
12.4 Higher-order tensor products	523
12.4.1 Multivariate Bézier manifolds	523
12.5 Transfinite methods	527
12.5.1 Rationale of the approach	527
12.5.2 Univariate case	529
12.5.3 Multivariate case	529
12.5.4 Transfinite Bézier	531
12.5.5 Transfinite Hermite	533
12.5.6 Connection surfaces	533
12.5.7 Coons' surfaces	536
12.5.8 Thin solids generated by surfaces	539
12.6 Examples	540
12.6.1 Umbrella modeling (3): tissue canvas	541
12.6.2 Helicoidal spiral volume	543
12.6.3 Roof design for a sports building	547
12.6.4 Constrained connection volume	548
13 Basic solid modeling	555
13.1 Representation scheme	555
13.1.1 Definition and properties	556
13.1.2 Taxonomy of representation schemes	559
13.2 Enumerative schemes	560
13.2.1 Flat enumerative schemes	560
13.2.2 Hierarchical enumerative schemes	562

13.3	Decompositive schemes	563
13.3.1	Simplicial schemes	564
13.3.2	Convex-cell partitioning and covering	564
13.4	Constructive Solid Geometry	569
13.5	Boundary schemes	570
13.5.1	Adjacency and incidence relations	572
13.5.2	Euler equation	573
13.5.3	Edge-based schemes	574
13.5.4	Facet-based schemes	577
13.5.5	Mass and inertia properties	586
13.6	Examples	592
13.6.1	Umbrella modeling (4): solid parts	592
14	Dimension-independent PLaSM operators	595
14.1	Inside Hierarchical Polyhedral Complexes	595
14.2	Boolean operations	600
14.2.1	Algorithm	601
14.2.2	Optimizing by pruning and unpruning	610
14.2.3	Interface to PLaSM operators	611
14.2.4	Linear Programming implementation	612
14.2.5	Boundary-to-interior operator	614
14.3	Dimension-independent integration	617
14.3.1	Tensor of inertia	620
14.4	Generalized product of polyhedra	622
14.4.1	Definitions	623
14.4.2	Product of cell-decomposed polyhedra	627
14.4.3	Intersection of extrusions	630
14.5	Skeleton extraction	633
14.5.1	Algorithm	635
14.6	Extrusion, sweep, offset and Minkowski sum	638
14.6.1	Background	639
14.6.2	Unified approach	640
14.6.3	Algorithms	641
14.7	Annotated references	648
15	Motion modeling	649
15.1	Degrees of freedom	649
15.2	Configuration space	653
15.3	Animation with PLaSM	655
15.3.1	Some definitions	656
15.3.2	Generating FLASH animations	656
15.3.3	Generating VRML animations	660
15.4	Motion coordination	667
15.4.1	Non-linear animation	667
15.4.2	Network programming	669
15.4.3	Modeling and animation cycle	672
15.5	Extended Configuration Space	680

15.5.1	Introduction	680
15.5.2	Rationale of the method	680
15.5.3	ECS algorithm	681
15.5.4	Encoding degrees of freedom	682
15.5.5	Computation of FP	686
15.6	Examples	689
15.6.1	Umbrella modeling (5): animation	689
15.6.2	Non-holonomic planar motion	690
15.6.3	Anthropomorphic robot with 29 degrees of freedom	693
15.6.4	Solving a 2D labyrinth	696
Appendix A Definition of MyFont		701
Appendix B PLaSM libraries		705
B.1	Standard	705
B.2	animation Library	719
B.3	colors Library	720
B.4	curves Library	723
B.5	derivatives Library	724
B.6	drawtree Library	725
B.7	flash Library	726
B.8	general Library	726
B.9	myfont Library	729
B.10	operations Library	730
B.11	primitives Library	732
B.12	shapes Library	735
B.13	splines Library	737
B.14	strings Library	739
B.15	surfaces Library	739
B.16	text Library	740
B.17	transfinite Library	741
B.18	vectors Library	741
B.19	viewmodels Library	744
